I will present an overview of the observing campaign that supported the ESA Rosetta mission between 2013 and 2016. This campaign included nearly all major observatories world-wide, and many smaller facilities, plus a related amateur astronomer effort. The campaign contained a total of 1300h of successful observations of the comet from more than 40 professional telescopes. I will discuss how this time was secured and how the campaign was coordinated, including what elements worked well and where lessons can be learned for future mission support campaigns, such as the Didymos observations around the DART impact in 2022.
